AI Usage Documentation

CareerConnect recruiter job board

AI tool	Claude (Anthropic), used through the claude.ai chat interface (Claude Sonnet 5.5)
Project	CareerConnect: Node/Express + SQLite server, React + Vite client
Input from the user	Two uploaded repository snapshots (CareerConnect-dev.zip and CareerConnect-dev_1.zip) and written requests
Output delivered	Source files, tests, and documentation as downloadable files, each with its repository path and a new/modified label

1. Summary

Claude was used as a coding assistant to add a recruiter job-posting feature to an existing codebase. It read the uploaded code, wrote new server and client code and tests, ran those tests in a sandbox, and returned the files for the user to copy into the repository. The user supplied the requirements, chose which snapshot to build on, and is responsible for reviewing, running, and committing the result. Claude did not have access to the user's repository, git history, or deployed environment; it worked only on the uploaded copies.

- **Written by Claude in this chat:** the recruiter job API, role middleware, validation, the recruiter dashboard, route guard wiring, styles, and automated tests (server and client).
- **Found already present in Claude's working copy, not written by Claude:** the publish/edit form's availability (open/closed) control and the matching server `status` handling. Claude reviewed and tested these but cannot say who wrote them (see section 5).
- **Verification:** 192 server tests and 57 client tests passed in the sandbox, and the client build succeeded. The server tests ran against a temporary stand-in for the SQLite driver (see section 4).

2. What was asked and what the AI did

#	Request	What Claude did	Result
1	Authenticated API endpoints so recruiters can create, update, and manage their own job postings	Extracted and read the uploaded repo; matched its conventions; wrote a recruiter-only router, role middleware, job validation, and tests; documented the API.	7 routes under /api/recruiter/jobs; ownership enforced in SQL; tests passed.
2	Deliver modified/added files individually with repo locations	Copied each file out and labeled it new or modified, with its path.	6 files delivered.
3	React form for recruiters to publish and edit postings	Found a complete form, API helper, list page and tests already in the working tree; ran the client tests and build; made no changes. Later corrected an earlier statement: those files were not in the first zip's file listing.	No new code; 43 client tests and build passed.
4	Output the code files and say which are new vs modified	Diffed the working tree against the zip to label files. Reported that the tree also differed in files Claude had not touched.	14 client files delivered, with caveats.

#	Request	What Claude did	Result
5	Upload of a newer snapshot: check what must change	Found the new snapshot lacked the recruiter work and that earlier client files would overwrite its saved-jobs and statistics routes. Re-applied the work onto the new snapshot with minimal edits, added missing React imports to fix 21 failing tests, and re-ran everything.	Merged set delivered; 111 server and 33 client tests passed.
6	Recruiter dashboard to view and manage postings	Rewrote the postings page as a dashboard (summary cards, status filter, search, sort, per-posting actions), added styles, renamed the nav link, and wrote tests.	4 files; 40 client tests passed.
7	Let recruiters control whether postings are visible to job seekers	Found the open/closed control already implemented in the tree. Verified it, and probed job-seeker endpoints (list, filters, detail, apply, save, saved list, applications) against a hidden posting.	6 files delivered; behavior confirmed.
8	Output every file from the chat, labeled; then only the server files	Diffed the tree against the newest snapshot and produced the cumulative lists.	20 files, then the 5 server files.
9	Troubleshoot 'vite: command not found'	Explained that client dependencies were not installed and gave the fix (npm install, dev-dependency checks).	Advice only.
10	Test creation, updates, authorization, and status management	Wrote about 75 additional server tests and 14 client tests. They exposed a real bug (a token for a deleted account caused a server error), which Claude fixed. Broke the code on purpose five ways to confirm the tests fail when they should.	5 files; 192 server and 57 client tests passed.
11	Move work from dev to features/recruiter-board (not pushed)	Gave git commands: create the branch, commit, push, then reset local dev to the remote.	Advice only.
12	Document the AI usage in this chat	Compiled this record from the conversation.	This document.

3. Files produced with AI assistance

New or modified is measured against the newest uploaded snapshot (CareerConnect-dev_1.zip). Paths are relative to the repository root.

Status	Repository path	Purpose
New	server/src/routes/recruiterJobs.js	Recruiter job API (list, create, read, update, close, reopen, delete)
New	server/src/middleware/requireRole.js	Role gate; checks the account in the database
Modified	server/src/app.js	Mounts /api/recruiter/jobs
Modified	server/src/validation.js	Job input validation, including open/closed status
New	server/tests/recruiter-jobs.test.js	Core API tests
New	server/tests/recruiter-jobs-edge-cases.test.js	Authentication, authorization, limits, status, deletion tests

Status	Repository path	Purpose
Modified	docs/database.md	Recruiter API and availability documentation
New	client/src/pages/JobForm.jsx	Publish / edit form (found in the working tree, reviewed and tested)
New	client/src/pages/MyJobs.jsx	Recruiter dashboard
New	client/src/recruiterJobsApi.js	Client calls to the recruiter API
New	client/src/auth.js	Session helpers (token, expiry)
New	client/src/components/RequireAuth.jsx	Route guard with optional role
New	client/src/test/makeToken.js	Test helper for fake tokens
New	client/src/pages/JobForm.test.jsx, MyJobs.test.jsx	Form and dashboard tests
New	client/src/components/RequireAuth.test.jsx	Route guard and recruiter route tests
Modified	client/src/App.jsx	Recruiter routes behind the role guard
Modified	client/src/components/AppLayout.jsx	Dashboard link for recruiters
Modified	client/src/styles.css	Recruiter, availability, and dashboard styles
Modified	client/src/test/setup.js	Test cleanup between tests
Modified	client/package.json, package-lock.json	Adds @testing-library/user-event; lockfile regenerated

4. How the output was checked, and the limits of that checking

- **Automated tests:** 192 server tests (10 suites) and 57 client tests (6 files) passed; the Vite production build succeeded.
- **Mutation check:** Claude temporarily broke the ownership check, the close/reopen scoping, the role gate, status handling on create, and the delete-with-applications rule. Each change made tests fail; the code was restored afterwards.
- **Job-seeker view:** a hidden posting was confirmed unavailable in listings, filters, detail, apply and save; existing applications were kept; reopening restored everything.
- **Limit - database driver:** the sandbox could not build the native `better-sqlite3` package, so server tests ran against Node's built-in SQLite through a temporary stand-in that was not delivered. Results should be confirmed with `npm test` in server/.
- **Limit - no browser or live run:** client tests mock network calls. Nothing was exercised in a real browser or against a running server.
- **Limit - lockfile:** package-lock.json was regenerated in the sandbox and changes more than one package; it should be reviewed.

5. Provenance, corrections, and open issues

Provenance. Claude's working copy was not always identical to the uploaded zips. Files such as the form, the dashboard page, and the server `status` handling appeared in the working tree in ways Claude had not written,

and the tree differed from the zips in other files (database, profile, resume code and docs) that Claude did not touch. Claude reported this when it noticed it and did not claim authorship of those changes.

Corrections made during the chat

- Claude first said the form 'was already in the uploaded repo'; the zip listing showed otherwise, and it corrected this.
- Client files first delivered for the older tree would have overwritten the newer snapshot's routes; Claude caught this on the new upload and merged instead.
- Missing React imports caused 21 test failures on the newer snapshot; fixed in the delivered files.
- Tests found a real defect (deleted-account token returned a server error); fixed in requireRole.js.

Known gaps (not implemented)

- Recruiters cannot view applicants or change application status; the dashboard shows counts only.
- A seeker who applied to a posting later closed can still click it in My Applications and see 'Job not found'.
- The deleted-account weakness was fixed only on recruiter routes; other endpoints that trust the token alone are likely affected.
- The app has no sign-out button, and login still sends every user to /profile.

6. Recommended human review before merging

- Run `npm test` in server/ and client/ with the real dependencies, and open the pages in a browser.
- Review authorization and validation code (recruiterJobs.js, requireRole.js, validation.js) as security-sensitive.
- Diff the lockfile, and confirm which team member or tool wrote the tree-only changes noted in section 5.
- Check that generated folders such as server/uploads/ are git-ignored before committing.
- Follow any course, employer, or project policy on disclosing AI-assisted work.
