

AI Usage Documentation

Project: SOEN 341 – CareerConnect (Sprint 1) **Scope of this log:** Front-end UI tasks #25 (Profile page), #27 (Resume upload UI), #29 (Resume list UI), and Layout & styling **Tool used:** Claude (Claude Sonnet 5, by Anthropic) via the claude.ai chat interface **Date:** September 27, 2026

1. Summary

Claude was used to generate a **UI-only front-end template** for the Profile, Resumes, and layout tasks. No backend, API, or data logic was requested or produced. The output was first delivered as a single HTML page, then redone as React components matching the project's file names. This document records every prompt, what the AI did in response, and what still requires human work.

2. Input provided to the AI

- Uploaded file:
SOEN341_CareerConnect_Project_Sprint1.docx (project description for context)
- The AI extracted the document text (Python `python-docx`) to understand the project before building.

3. Prompt log

Prompt 1 – Task assignment (with uploaded docx)

Profile page (#25)

- Own Profile.jsx: loading and saving, the success and error banners, a comma-separated skills field, and a character counter on the About field.
- Recruiters see a Company field and no Skills field.

Resume upload UI (#27)

- Own the upload area in Resumes.jsx: drag and drop plus a file picker, an "Uploading..." state, and showing the API's error message (wrong type, too big, limit reached).

Resume list UI (#29)

- Own the list: name, size, and date for each resume, the "Primary" tab, and the Download, Make primary, and Delete buttons (Delete asks for confirmation).

Layout and styling

- Own AppLayout.jsx (top bar and navigation) and styles.css.
- Check the pages at phone width and keyboard focus visibility.
- Take screenshots of each screen for the demo and for the team's reference in future sprints.

do these tasks associated with the project in the file. just make the front end template. you can have buttons but they must not do anything. just do the ui

AI output: A single self-contained HTML file (`careerconnect-ui.html`) containing the Profile page, Resumes page (upload area + list), shared top bar/nav, responsive styles down to phone width, and visible keyboard focus rings. It was also published as a hosted page. Action buttons (Save, Download, Make primary, actual Delete) were left non-functional. Structural UI behaviors were wired: page navigation, role preview toggle (Recruiter shows Company, hides Skills), live About character counter, banner preview toggles, resume tabs, and the Delete confirmation dialog.

Prompt 2 – View source

show code

AI output: Displayed the full source of the HTML file.

Prompt 3 – Convert to React

redo it with react framework

AI output: Rebuilt the UI as React source files using the file names from the tickets:

File	Purpose
src/App.jsx	Wires layout and pages together; holds page/role state
src/components/AppLayout.jsx	Top bar, main navigation, role preview select
src/pages/Profile.jsx	Profile form, About counter, Skills/Company by role, banners
src/pages/Resumes.jsx	Upload area, static "Uploading..." and error states, resume list, tabs, delete confirmation
src/styles.css	Shared styles, responsive rules, focus-visible styles

Uses plain React with `useState` only (no extra libraries). Data is hard-coded sample data.

Prompt 4 – This document

make a .md document, documenting ai usage in this chat including this prompt

AI output: This file.

4. What the AI did NOT do

- **No real functionality:** No API calls, saving/loading, file upload, download, make-primary, or delete logic (per the instruction "buttons must not do anything").
- **No screenshots:** The "take screenshots of each screen" item remains a manual task for the team.
- **No phone-width / keyboard-accessibility audit:** Responsive rules and focus styles were written into the CSS, but the AI did not run a browser test. The team must verify these manually.
- **React files not compiled or run:** The React version was written but not built or executed in a Vite/CRA project during this chat. It should be tested in the actual project before merging.
- **No integration with the team's real codebase:** Existing routing, auth context, API client, or design tokens in the repo were not seen by the AI and may conflict with the template.

5. Human review checklist

- ☐ Run the React files in the project and fix any import/path issues
 - ☐ Check layout at phone width (~375px) and with keyboard-only navigation (Tab / Shift+Tab / Enter)
 - ☐ Replace hard-coded sample data and demo-only controls (role "Preview as" select, banner preview buttons, static upload state examples) with real state/API wiring
 - ☐ Confirm styling matches the team's conventions
 - ☐ Capture screenshots of each screen for the demo and future-sprint reference
 - ☐ Review and understand all AI-generated code before submitting it as your own work, and follow the course's academic-integrity policy on AI disclosure
-

6. Artifacts produced

- `careerconnect-ui.html` – single-file HTML version (first iteration) (this file was not used)
- `src/` – React version (`App.jsx`, `AppLayout.jsx`, `Profile.jsx`, `Resumes.jsx`, `styles.css`) (this folder was used)
- `AI.md` – this document
