

AI Usage Documentation

SOEN 341 – CareerConnect, Sprint 1 – Front-end UI tasks (#25, #27, #29 and Layout/Styling)

1. Summary

An AI assistant was used in a single chat session to produce a static, UI-only front-end template for the Profile page, Resume upload, Resume list, and the shared layout/styling assigned in the Sprint 1 project document. The assistant wrote all of the HTML, React (JSX) and CSS code delivered in the session. The assistant did not implement any backend, API, or real save/upload/delete logic, as instructed.

2. Tool and session details

Item	Detail
AI tool	Claude (Sonnet 5), developed by Anthropic, used via the claude.ai chat interface
Session date	September 27, 2026
Input provided	Uploaded file: SOEN341_CareerConnect_Project_Sprint1.docx (read by the AI for project context)
Number of user prompts	4
Tools the AI used	Document text extraction (python-docx), file creation, ReportLab (this PDF), an artifact publishing tool (hosted HTML preview)

3. Chronological log of prompts and AI responses

Prompt 1 – Initial task request (with uploaded project document)

Profile page (#25)

- * Own Profile.jsx: loading and saving, the success and error banners, a comma-separated skills field, and a character counter on the About field.
- * Recruiters see a Company field and no Skills field.

Resume upload UI (#27)

- * Own the upload area in Resumes.jsx: drag and drop plus a file picker, an "Uploading..." state, and showing the API's error message (wrong type, too big, limit reached).

Resume list UI (#29)

- * Own the list: name, size, and date for each resume, the "Primary" tab, and the Download, Make primary, and Delete buttons (Delete asks for confirmation).

Layout and styling

- * Own AppLayout.jsx (top bar and navigation) and styles.css.
- * Check the pages at phone width and keyboard focus visibility.
- * Take screenshots of each screen for the demo and for the team's reference in future sprints.

do these tasks associated with the project in the file. just make the front end template. you can have buttons but they must not do anything. just do the ui

AI response: Read the uploaded Sprint 1 document, then generated a single self-contained HTML page (careerconnect-ui.html) containing a Profile page, a Resumes page (upload area and list), and a shared top bar/nav, with responsive styling and visible keyboard focus. Action buttons were left non-functional. The AI also published it as a hosted preview page. The AI noted that taking screenshots remained the student's responsibility.

Prompt 2 – Request to see the code

show code

AI response: Displayed the full source of the HTML file created in Prompt 1.

Prompt 3 – Request to convert to React

redo it with react framework

AI response: Regenerated the UI as React source files matching the project's file names: App.jsx, components/AppLayout.jsx, pages/Profile.jsx, pages/Resumes.jsx, and styles.css (plain React with useState, no external libraries). Save, Download, Make primary and the final Delete remained no-ops.

Prompt 4 – Request for this document

make a pdf document, documenting ai usage in this chat including this prompt

AI response: Generated this PDF.

4. Deliverables produced by the AI

File	Description
careerconnect-ui.html	Single-file HTML/CSS/JS version of the UI (Prompt 1); also published as a hosted preview
src/App.jsx	Wires AppLayout to the Profile and Resumes pages (Prompt 3)
src/components/AppLayout.jsx	Top bar, main navigation, role preview selector (Prompt 3)
src/pages/Profile.jsx	Profile form, About character counter, Skills vs. Company field by role, banner previews (Prompt 3)
src/pages/Resumes.jsx	Drag-and-drop/file picker area, upload and error examples, resume list with tabs and action buttons, delete confirmation dialog (Prompt 3)
src/styles.css	Shared styles: layout, forms, table, modal, responsive rules, focus outlines (Prompt 3)
AI_Usage_Documentation.pdf	This document (Prompt 4)

5. Scope and limitations

- **UI only.** No loading, saving, uploading, downloading, deleting, or API calls are implemented. Sample data (names, file names, sizes, dates) is placeholder content invented by the AI.
- **Interactive UI behavior included:** page navigation, role preview toggle, live About character counter, resume tabs, drag-over highlight, banner preview buttons, and opening/closing the delete confirmation dialog.
- **Not done by the AI:** screenshots of each screen, real-device phone-width testing, and keyboard/accessibility audits. The code includes responsive CSS and focus-visible outlines, but these were not verified by running the app in a browser during the chat.
- **Not integrated:** the React files were not built or run inside the team's actual repository, so import paths, build tooling and styling conflicts have not been checked.

6. Human contribution and review

The student defined the task scope, supplied the project document, chose to restrict the work to a non-functional UI template, and requested the React conversion. The student is responsible for reviewing, testing, adapting and integrating the AI-generated code, connecting it to the real API in later work, capturing the required screenshots, and confirming that this usage complies with the course's academic integrity and AI-use policy.
