

Task: Registration Page Implementation

Purpose of AI Use:

Code generation/review, UI design, and implementation guidance for the registration page.

Chat Link or Prompt/Response:

<https://chatgpt.com/share/6ab9c68e-a8a8-83ea-bac0-7322ee822f19>

AI-Suggested Content:

ChatGPT suggested a structure for the registration page using `Register.jsx` and a reusable `Field.jsx` component. It also provided guidance for implementing the user-role selector, displaying field-level validation errors returned by the API, and redirecting the user after successful registration.

Validation:

The suggestions were reviewed against the Sprint 1 requirements and the existing frontend structure. The registration page was manually tested in the browser with valid and invalid inputs. The frontend was also checked using the project's lint/build commands.

Decision:

Modified before use.

Reflection:

The AI helped organize the registration component and identify how frontend validation and API errors could be handled. Some suggestions required modification to match the project's existing component structure and backend API.

Responsible Person:

Wyndair Daryl Bartolome

Task: Frontend Client Setup with React and Vite

Purpose of AI Use:

Project setup, planning, and troubleshooting.

Chat Link or Prompt/Response:

<https://chatgpt.com/share/6ab9c73d-2fac-83ea-b7d7-ddabb1d99e32>

AI-Suggested Content:

ChatGPT provided guidance for creating and organizing the React frontend using Vite, including the `components` and `pages` directories and the use of the provided npm scripts. It also explained how to run the development server and verify the frontend setup.

Validation:

The frontend was launched using `npm run dev`, and the application was accessed successfully through the Vite development server. The production build was also tested using `npm run build`.

Decision:

Accepted with minor modifications.

Reflection:

The AI helped clarify the Vite development workflow and frontend folder organization. This was useful because the project uses a development server rather than opening an HTML file directly in the browser.

Responsible Person:

Task: Integration of Registration/Login Frontend with Team `dev` Branch

Purpose of AI Use:

Git troubleshooting and project integration.

Chat Link or Prompt/Response:

<https://chatgpt.com/share/6ab9c7e3-dc58-83ea-b56b-e910e94b3850>

AI-Suggested Content:

ChatGPT provided guidance for incorporating the team's latest `dev` branch changes into the frontend work before pushing the registration and login implementation. It explained the Git workflow and how to verify the project after integration.

Validation:

The latest team changes were incorporated, the application was run again, and the frontend was successfully built before the updated work was pushed to the shared branch.

Decision:

Accepted with modifications appropriate to the repository state.

Reflection:

The AI guidance helped clarify how to integrate personal feature work with changes made by other team members without discarding existing work. The repository status and application behavior were checked manually before pushing.
