CareerConnect - Job Search and Application Tracking Platform

Sprint 2 Summary Report Date Due: October 26th, 2026

Sprint Objectives :

Sprint 2 aimed to expand CareerConnect beyond authentication, profile management, and resume uploads by introducing job posting management, job searching, application submission, and status tracking. The team also focused on improving frontend-backend integration, testing, and collaboration.

Features and Functionality Implemented :

The team implemented a job listings API, a React job browsing page, reusable job cards, and a job details interface. Keyword searching, empty-result handling, and API error messages were added. Automated tests were developed for job retrieval and searching, alongside a GitHub Actions workflow for backend testing, frontend testing, and build verification. Job filtering, application submission, and recruiter management features remain in development.

Team Innovation and Original Features:

The team proposed AI-assisted resume feedback to help job seekers identify improvements before submitting applications. This feature is planned for further development. An additional team-original feature will be documented separately.

Challenges and Resolutions :

Coordinating frontend and backend development presented integration challenges. The team addressed these through clear task assignments, GitHub collaboration, incremental integration, and automated testing to identify errors and maintain compatibility.

Team Contributions : Roles in the codebase:
-> Xavier: Scrum master, meeting minutes, review/add user stories, tasks, update board, backlog, plan -> Salvatore: Frontend, display opportunities, filtering, description -> Philip: frontend for job postings (upload/edit api), acceptance tests, job application submission and tracking
-> Daryl: Backend for job postings (all_postings, get_desc, apply api) -> Vincent: Job status api, confirmation, Frontend for seeker profile/cv management -> Benjamin: github workflow, branch management and pull request's/merging branches. Implemented the backend tasks (#31, #32, #33, #35, #37, #40)
